

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

Claim 1 (currently amended): A system for assisting in selling vehicles, the system comprising an application server, a database server connected with the application server by a network, and a plurality of mobile terminals connected with the application server by a communication channel, wherein:

the application server comprises ~~a cache manager, a replication manager, and a domain manager, wherein:~~

~~the a~~ cache manager ~~is used to receive~~ configured for receiving and store storing information sent by the mobile terminals and the database server;

~~the a~~ replication manager ~~comprises~~ comprising a first data filter module, ~~which is used to filter~~ the first data filter module configured for filtering information added in the database server, and ~~to modify~~ configured for modifying existing information in the database server and the mobile terminals; and

~~the a~~ domain manager ~~is used to manage~~ configured for managing domains;
each of the mobile terminals comprises ~~a budget module, a link switching module, a data synchronization module, a second data filter module, and a data storage, wherein:~~

~~the a~~ data storage ~~is used~~ configured for storing information downloaded from the application server and input from the mobile terminals;

~~the a~~ link-switching module ~~is used~~ configured for switching connection states as between the mobile terminal and the application server, said connection states comprising a connected state and a disconnected state;

~~the a~~ budget module ~~is used~~ configured for calculating payable fees relating to vehicles within the purview of a client by using one or more preset formulas stored in

the data storage, and for generating one or more budget plans in a table form;

~~the~~ a data synchronization module ~~is used~~ configured for downloading information for synchronization from the application server, and for storing the downloaded information in the data storage; and

~~the~~ a second data filter module ~~is used~~ configured for filtering modification of data stored in the data storage, said modification performed when the mobile terminal is in the disconnected state, and for sending data thus modified to the data synchronization module; and

the database server ~~is used~~ configured for storing information on clients, vehicles, employees and budget definitions.

Claim 2 (original): The system for assisting in selling vehicles as described in claim 1, wherein the budget module further comprises an installment budget sub-module, a government fees budget sub-module, an insurance payment budget sub-module, and a budget plan menu generating sub-module.

Claim 3 (original): The system for assisting in selling vehicles as described in claim 1, wherein each of the mobile terminals further comprises an information searching module for searching information stored in the data storage.

Claim 4 (original): The system for assisting in selling vehicles as described in claim 1, wherein each of the mobile terminals further comprises an account setting module for setting dial-up accounts for connections in regions which a user of the mobile terminal routinely visits.

Claim 5 (original): The system for assisting in selling vehicles as described in claim 1, wherein each of the mobile terminals can be a personal digital assistant, a laptop computer, or a smart phone.

Claim 6 (previously presented): A method for assisting in selling vehicles, the method comprising the following steps:

(a) connecting a mobile terminal with an application server;

- (b) sending a synchronization request to the application server;
- (c) synchronizing information stored in a database server and in the mobile terminal;
- (d) selecting from a data storage information on a vehicle within the purview of a client, including information on fees relating to the vehicle; and
- (e) using one or more preset formulas to calculate payable fees in relation to the vehicle, and displaying a budget plan result generated in a table form on the mobile terminal.

Claim 7 (original): The method for assisting in selling vehicles as described in claim 6, further comprising the step of:

searching and checking the information synchronized.

Claim 8 (original): The method for assisting in selling vehicles as described in claim 7, wherein said information synchronized comprises information on any one or more of clients, vehicles, and employees.

Claim 9 (original): The method for assisting in selling vehicles as described in claim 6, further comprising the step of:

selecting one or more budgetary parameters.

Claim 10 (original): The method for assisting in selling vehicles as described in claim 6, wherein the one or more preset formulas are stored in the data storage.

Claim 11 (original): The method for assisting in selling vehicles as described in claim 6, further comprising the step of:

cutting the connection between the mobile terminal and the application server after synchronization.

Claim 12 (currently amended): A system for assisting in selling vehicles, the system comprising an application server, a database server connected with the application server by a network, and a plurality of mobile terminals connected with the application

server by a communication channel, wherein:

the application server comprises ~~a cache manager, a replication manager, and a domain manager, wherein:~~

~~the a~~ cache manager ~~is used to receive~~ configured for receiving and ~~store~~ storing information sent by the mobile terminals and the database server;

~~the a~~ replication manager ~~comprises~~ comprising a first data filter module, ~~which is used to filter~~ the first data filter module configured for filtering information added in the database server, and ~~to modify~~ configured for modifying existing information in the database server and the mobile terminals; and

~~the a~~ domain manager ~~is used to manage~~ configured for managing domains;
each of the mobile terminals comprises ~~a link-switching module, a data synchronization module, a second data filter module, and a data storage, wherein:~~

~~the a~~ data storage ~~is used~~ configured for storing information downloaded from the application server and input from the mobile terminals;

~~the a~~ link-switching module ~~is used~~ configured for switching connection states as between the mobile terminal and the application server, said connection states comprising a connected state and a disconnected state;

~~the a~~ data synchronization module ~~is used~~ configured for downloading information for synchronization from the application server, and for storing the downloaded information in the data storage; and

~~the a~~ second data filter module ~~is used~~ configured for filtering modification of data stored in the data storage, said modification performed when the mobile terminal is in the disconnected state, and for sending data thus modified to the data synchronization module; and

the database server ~~is used~~ configured for storing information on clients, vehicles, employees.

Claim 13 (previously presented): The system for assisting in selling vehicles as described in claim 12, wherein each of the mobile terminals further comprises an account setting module for setting dial-up accounts for connections in regions which a user of the mobile terminal routinely visits.
